Abstract (en)

[origin: EP0232901A1] Power divider in a waveguide (10) operating under linear polarisation and fed by a wave, of wavelength lambda g, in the fundamental mode. This device includes in its end a second guide (11) at the break forming a short-circuit plane (18) with the first guide, and at least two perpendicularly-directed radial slots (14, 15) arranged at the periphery of the first guide at a specified distance from the short-circuit plane (18) in such a way that the energy coupled in these slots is a maximum, the radial direction of one of these slots forming a specified angle relative to the plane of polarisation of the wave incident in the mid-plane perpendicular to these two slots (14, 15). <IMAGE>
