Abstract (en)
[origin: EP0233561A2] The invention relates to a device for withdrawing money from gaming machines. The coin-collecting container 3 on the machine is designed as a discharge device 2 which is connected to a counter 5 and to an on/off switch 23. The on/off switch 23 is designed as a key-operated switch. After the on/off switch 23 has been actuated, the coin-collecting container 3 designed at the same time as a discharge device pays a specific number of coins recorded by the counter 5 into a dispensing shell 32 or a coin-collecting funnel 14. Since the on/off switch 23 can be activated from outside and the recording of the discharged number of coins is carried out in the gaming machine 1, the latter does not have to be put out of operation in order to withdraw the coins. <IMAGE>
