Abstract (en)

In a respiratory protective mask (1) with releasably mounted filters (3 and 4), at least the coupler (5) between two filters (3 and 4) is constructed as a sort of bayonet coupler with radially outwardly protruding lock protrusions (27) and lock pockets (12) protruding radially inwardly from an axial flange (11), one filter (4) being formed with two axially protruding sealing beads (17,18) which cooperate with a sealing bead (26) protruding radially outwardly from the other filter (3). When inserting the lock protrusions (27), they are guided by the inner side of the axial flange (11), so that the sealing bead (26) hits the space between the sealing beads (17 and 18).
