Abstract (en)

[origin: EP0234486A1] 1. A device (10) for dispensing connected flat segments (13) which are provided in a supply (11) and form a tape (12) and which are restricted from one another in segments by predetermined tearing lines (14) formed by stampings, perforations, grooves or the like, which device (10) has, in the delivery region (21) of the tape (12), a tape delivery face (22) in which a tape tearing abutment (23, 24) projecting from this face (22) is provided for dimensionally accurate engagement in an opening (15, 150) stamped from the tape (12), characterised in that the tape tearing abutment consists of two mutually spaced projections (23, 24) orientated substantially orthogonally to the tape delivery face (22), against whose rear edge in the take-off direction the stamped line (20, 200) of the engagement openings (15, 150) of the tape (12) hinged round the front edge is placed, so that, as pulling proceeds, the tearing process of the front segment of tape (12) is initiated along the predetermined tearing line (14) running transversely in the region of the engagement openings (15, 150).
