Abstract (en)

[origin: US4755278A] This process for fractionating solid asphalts is operable under low temperature and pressure conditions. The process consists of treating a suspension of asphalt powder in a surfactant-containing aqueous phase by means of a hydrocarbon solvent immiscible with water and of separating: an hydrocarbon phase containing asphalt of softening point lower than that of the initial asphalt, and an aqueous phase wherein is suspended asphalt of softening point higher than that of the initial asphalt.
