Abstract (en)  
[origin: EP0235107A2] The invention relates to improvements in a profiled sheet (1) for construction purposes with the aim of reinforcing the profiled sheet by support means (10) in the region of a beam (2) supporting the profiled sheet, said beam extending transversely of the profiling direction of the profiled sheet (1). The support means (10) are at least partly located on the side of the profiled sheet (1) turned from the beam (2). The profiled sheet (1) has profilings (12) and/or holes (13) to enable fixing of the support means (10) to it without using separate attaching means. It is extraordinarily easy to mount the support means (10), for instance using a simple hand tool, to the profiled sheet (1) even when this is anchored to the beams (2).
