Abstract (en)

[origin: WO8701017A1] The support has a back-plate (1) which on one side follows the shape of the human body and on the other side has means for securing the loads. The support has a plurality of differently-sized openings (7, 11) arranged in mirror-image symmetry in relation to its central axis and intended for securing the loads to be carried (8, 9, 10). The openings are positioned and laid out in such a manner as to provide a system for arranging the loads to be carried.
