Abstract (en)

[origin: US4774761A] This invention concerns a process for changing electric lines, especially for cutting a line to length and equipping cut line segments with electric connectors especially in an automatic cable finishing machine with lateral transport of the cut line segments with endless belts, where several different lines each unwound from a cable drum are stored on an arc of a circle, so they are parallel to each other with a certain distance apart and they are pivoted together on the arc of the circle for the purpose of changing the lines until a predetermined line is positioned at the culmination point of the arc. This invention also concerns a device for carrying out this process, characterized by a line storage device with support points for lines arranged on an arc extending across the transport direction of a line that is to be cut and arranged so they are spaced a certain distance apart, where the storage device is mounted so it can be pivoted back and forth in the direction of the arc.
