Abstract (en)
[origin: EP0236788A2] The support (2) consists of a U-shaped clamp strap. A carrier (4) carrying the microphone (5) is displaceably supported on the curved part (3) of the clamp strap (2). The direction of the axis (7) of the microphone (5) on which the latter has its highest sensitivity can be adjusted for the sound source by displacing the microphone carrier (4) along the curved part (3) of the strap. The extremely simple microphone support which can be produced inexpensively enables the direction of highest sensitivity to be accurately adjusted for the sound source independently of the position of the object on which the support is mounted, which is essential for transmission without feedback especially in the case of free intercommunication. <IMAGE>
