Abstract (en)

[origin: EP0236883A2] The process is used to produce a detoxicating emulsion, in particular for ABC combat agents, in which the substances are mixed in accordance with a specified formulation and sprayed under pressure. The water is first sucked out of a water container 1 by a main pump 2 whose pressure side is again connected to the water container 1 via a short-circuit loop 4. A substream of water is then tapped off via a pipeline 5 and used for mixing with the substance C 8 (calcium hypochlorite). The mixture consisting of A 4 and an emulsifier are then fed via a metering pump 10 to the main pipeline 12 in accordance with a first mixing section 36 and in a second mixing section 37, the slurry consisting of water and C 8 is added to the main pipeline 12. While maintaining an adequate development time, possibly using an inliner 34, the emulsion is discharged via discharge lances 14. <IMAGE>
