Abstract (en)

[origin: WO8701566A1] Process for producing an inner shoe for a ski-boot by expanding foam to form the inner shoe in situ, whereby the foot of the wearer is covered with a double-walled stocking (hollow stocking) (14) and is placed in the ski-boot. The foam mass in the front and preferably bending region of the shoe is fed by tubes into the hollow space of the sock until it emerges over the point of entry and if necessary also via tubes (9 or 9') at the pointed end of the hollow space.
