Abstract (en)

[origin: EP0237901A2] The pipe leads from a supply to a shower head etc and connected to a variable vol. metering chamber. The latter contains a piston whose crown forms one end of the chamber, with the other end closed by a cover acting as a stop for the piston. Alternatively, the end face of the piston working in the chamber (22) interrupts the connection between it and the remaining part. At the inlet (60) an integral mechanism, temporarily interrupts the flow in a pipe and contains a plug between the inlet and outlet ends, moved by the pressure of the water flow against a spring action.
