Abstract (en)

[origin: EP0238842A2] The washing machine has a driven mechanical programme switch gear and an out-of-balance monitoring device which, when a large degree of out-of-balance of the washing and spinning drum occurs, reduces the drive speed of the drive motor or puts it out of operation temporarily for the purpose of renewed distribution of the laundry. The drive of the mechanical programme switch gear is stopped for the duration of the distribution of the laundry and/or a measurement of the distribution of the laundry and/or a correction of the distribution of the laundry.
