Abstract (en)

[origin: EP0239053A2] In a prefabricated roller shutter box (1) of moulded bricks (2, 3, 4, 5) which have in cross section a roller shutter box profile in the form of an inverted U of two side webs (6, 7) and a centre web connecting these and are connected to one another by bonding agents and reinforcements, the reinforcements consist of rails (14, 15) resting against the ends (12, 13) of the two side webs (6, 7), extending essentially over the entire length of the roller shutter box (1) and connected to the ends by means of bonding agents, which reduces production time and manual effort. Independently of this, reinforcement rods can be used, particularly in the case of slotted moulded bricks. <IMAGE>
