Abstract (en)

[origin: WO8702021A1] A level winder for a winch has a cable control arm (36, 38, 40) movable between the edges of a drum (16) of the winch in a manner that define two cable path segments (66a, 66b), the sum of the lengths of which remains constant. The arm is pivotally mounted on a carriage (30) to swing back and forth from edge to edge of the drum in a plane parallel to the drum axis (14), while the carriage is pivotally mounted so the cable control arm can pivot toward and away from the drum.
