Abstract (en)

[origin: US4807423A] The present invention relates to a device for feeding covers to a continuously operating container closing machine. The device makes it possible continuously to feed covers to closure tools which revolve in a circular path and during their rotary movement descend, for the closing, onto containers moved past below the closing station, so that the closure tools place and close the covers on the containers. For the transfer of the covers, a cover guide path is moved over a certain region of the rotary movement of the closure tool synchronously and in alignment with the closure tools so that the covers can be delivered during this phase to the closure tool.
