Abstract (en)  
A photosensor has an optical fiber bundle (2) comprising a plurality of optical fibers (3), one end (2b) of which is spreadly arranged in a row opposite to a surface of an object to be detected and the other end (2a) of which is bundled in a small area corresponding to the photo-sensing portion (6a) of a photoelectric conversion element (6). Accordingly, an area, to be detected, of the object can be widely selected in spite of using a conventional phototransistor.
