Abstract (en)

[origin: EP0240440A2] The subject of the invention is connected with the technical field of the mechanical working of metals without substantial material removal. The hammer according to the invention is made from two mechanically separate parts, a support part (1) intended to be fixed onto an element of the machine, and another active part (2), of specified profile and intended to carry out the striking, the said parts (1) and (2) being arranged in combination with complementary assembly and locking-in-position means making it possible to carry out, as desired, their assembly and disassembly. <IMAGE>
