Abstract (en)
[origin: EP0240585A1] The construction of the self-locking buckle is as flat as possible and the retaining part (1) and buckle part (2) are constructed as frames with transverse webs (3-7) which can be loosely displaced on each other. The fixed end (8) of the belt passes through both frames, the transverse web (5) of the buckle part (2) which is surrounded by the belt being of wider construction than that of the retaining part (1) and a second transverse web (6) being assigned to said transverse web (5) as the actual buckle web which is arranged with its end face (9) with spacing from the second web (4), said spacing being designed to be smaller than the overhang (12), remaining counter to the pulling direction (11), of the surrounded transverse web (5). <IMAGE>
