Abstract (en)  
[origin: EP0240865A2] The stretcher holder consists of a platform for supporting the stretcher and an actuatable lifting element for raising the platform. The aim of the invention is to provide a stretcher holder in which movements of the vehicle, in particular sudden movements caused, for example, by bumps, do not cause discomfort to a patient lying on the stretcher. The aim is achieved according to the invention by virtue of the fact that the lifting element is an arm which at one end is articulated in a pivotable manner on a horizontal main axis, which is mounted on a floor attachment arranged on the vehicle floor, that the platform is held at the free end of the arm, that at least one drive element is provided for actuation of the arm, and that the floor attachment has a suspension with absorbing elements for the shock- absorbing arrangement of the main axis.
