Abstract (en)
[origin: EP0241031A2] For keeping the hair moist during hairdressing, warm water is sprayed from a container with a spray head (2) fitted on top. Inside the container is an inner vessel (3) holding the warm water, suspended at the top so that an insulating space (1) remains all round, between the inner vessel and container. The space can contain air or an insulating material. The inner vessel can be made of heat insulating glass and can be of the type used in a vacuum flask for hot or cold drinks.
