Abstract (en)
[origin: WO8701794A1] A device (11) for heating residential rooms (12) uniformly by equalising the temperature distribution between the level of the ceiling and of the floor includes a vertical column (13) that extends from the ceiling (17) to the floor (16). The column (13) contains a channel in which a blower and an electric heating element are arranged between an upper air inlet (18) and a lower air outlet (19). This device (11) ensures a uniform temperature distribution in the room, and simultaneously clearly reduces the heating power while improving the well-being of any persons staying in the room.
