Abstract (en)  
[origin: WO8701693A1] Dense ceramic composites comprising a mixture of a solid solution containing the elements Si, C, Al, O and N (referred to by the acronym SiCAION) and a high temperature refractory phase have desirable physical properties and can be formed by pressureless sintering techniques. The refractory phase can be SiC, AlN, Al<sub>2</sub>O<sub>3</sub>, or AlON and constitutes between 1 and 99% of the volume of the ceramic. The method for pressureless sintering may also be used for densification of SiCAION ceramics, or composites containing SiCAION, allowing fabrication of the same into complex shapes economically.
