Abstract (en)
[origin: EP0241674A1] Suspended element for scenery ceilings, the lateral faces of which are formed by sound-absorbing panels (1), a foil or a sheet (7) of substantially higher specific gravity than the panels being arranged between said panels (1) and a transversely extending metal section (4-6) being provided at the upper edge of the element. In order to be able to design suspended elements of greater length, according to the invention the metal section (4-6), on the one hand, and the foil (7) or the sheet (7), on the other hand, form an approximately T-shaped girder subject to bending, which is thus designed as a strength provider and permits large spans. <IMAGE>
