Abstract (en)

Ski boot with device for varying the flexibility, which comprises a shell (302) to which at least one quarter (303) is articulated. The peculiarity of the invention resides in the fact that it comprises, between two mutually movable parts (302,303) of a boot, a body (310) with variable elasticity. According to one aspect of the invention, the variable-elasticity body (310) defines in its interior at least one cavity (311) in which a filling body is removably insertable to vary the elastic deformability characteristics of the body (310), which is deformable at least in the direction of mutual movement of the two mutually movable parts (302,303).
