Abstract (en)

[origin: EP0243277A2] The device consists of at least one arm (11) articulated on the one hand to a fixed point (12) on the door frame (1) and on the other hand to the door leaf (6, 7) at a point (13) remote from the edges parallel to the axis about which the door leaf (6, 7) pivots. Means for guiding one of these edges restrains this edge from being moved against a plane P2 substantially perpendicular to the plane p1 of the frame (1) and contains a peripheral upright (4a or 4c) of the door frame (1). Means for manoeuvring a door leaf (7) are accessible through the two surfaces of this leaf (7). <IMAGE>
