Abstract (en)

Disclosed is a method for processing a light-sensitive silver halide color photographic material having at least one silver halide emulsion layer which comprises subjecting to image-like exposure and subsequently to processing including at least color development step and bleaching step, the improvement wherein a bleaching solution employed in said bleaching step contains at least one organic acid ferric complex; and said bleaching solution contains at least one organic acid in a range of not more than 10 mole % of the content of said organic acid ferric complex contained in said bleaching solution; and a replenished amount in said bleaching step is 30 m l to 300 m l per 1 m² of said silver halide color photographic material. This invention can provide a method for processing a light-sensitive silver halide color photographic material without any impairment of recoloring property even if a replenished amount of a bleaching solution is reduced.
