Abstract (en)  
[origin: EP0246456A2] The device for supplying textile pieces or the like to an application machine 9, 9' for press studs, rivets or the like has a positioning device for the textile pieces which can be controlled by an application program. In order to allow continuous application of the press studs or the like to the textile pieces or the like, without the operating sequence having to be interrupted when a new textile piece is placed on, it is proposed by the invention that the positioning device consist of a lower, continuously circulating transport belt 4 and an upper, likewise continuously circulating transport belt 12, that the two transport belts 4, 12 circulate adjacently at the same speed in the opposite direction, that the textile piece is spread for transportation between the two transport belts 4, 12, and that a signal transmitter 18 is arranged on the transport path of the textile piece before the application point 10 of the application machine 9, 9' for triggering the application program. <IMAGE>
