Abstract (en)
A silver halide color photographic material is disclosed, comprising a support having provided thereon at least one silver halide emulsion layer containing a cyan coupler, at least one silver halide emulsion layer containing a magenta coupler, and at least one silver halide emulsion layer containing a yellow coupler, in which said cyan coupler-containing emulsion layer contains (1) at least one of a specified type of cyan coupler, and (2) a high-boiling organic solvent in an amount of not more than 30% by weight based on the total amount of said specified type of cyan coupler. The photographic material exhibits improved sharpness without being accompanied by reduction in color developability or precipitation of crystals. These effects can be enhanced by using 2-equivalent polymeric magenta couplers in combination.
