Abstract (en)
[origin: EP0248282A2] The high-pressure cleaning device (10) has a boiler (32), which is arranged on a chassis, is fired by an oil burner, and to which the water to be heated is fed under pressure by means of a high-pressure pump (72) driven by an electric motor. At least the electric motor (78; 62) for driving the blower (52) as well as the oil pump (64) of the oil burner is arranged with an axis extending parallel to the longitudinal axis of the boiler immediately adjacent to the boiler (32). The blower (52) as well as the oil pump (64) of the oil burner is arranged in this case at a distance from the electric motor (62) driving the high-pressure pump (72) in an end region of the boiler (32) immediately adjacent to the latter, the blower housing being constructed as an integral part of the chassis (12). <IMAGE>
