Abstract (en)
[origin: EP0249087A1] 1. Thermal radiator for the heating of large areas or rooms with at least one radiation tube (10), on the one end of which a burner facility (20) is disposed and at the other end of which there is disposed an exhaust gas pipe (30) that can be connected to a chimney breeching, in which the radiation tube (10), within the area of the burner facility (20), is provided with a refractory insulation (50:150) for shielding against a direct flame action and against overheating and possesses a large diameter (D) suitable for the emission of long-wave thermal radiation, characterized in that a) the burner facility (20) is constructed in the form of a pressure oil nozzle burner (21) with a blower (22), b) the radiation tube (10) over its entire length (L) is provided with an insulating layer (60) which, with increasing distance from the burner facility, possesses a decreasing thickness and/or effectiveness and c) the radiation tube (10), over its entire length (L), is constructed so as to be gas-proof and in that the burner facility (20) is constructed so as to be operable within the excessive pressure ranges, while inside the radiation tube (10) and/or within the area of the exhaust gas pipe (30), a drag (170) is mounted.
