Abstract (en)

A process for the production of a laminar article containing a dye image composed of at least one organic dye produced or applied in silver halide photography in a supported hydrophilic binder layer, wherein at least a part of said hydrophilic binder layer is heated in a lamination procedure and protected with a protective thermoplastic resin layer or sheet that covers said hydrophilic binder layer containing said dye image, wherein said hydrophilic binder layer containing said dye image is treated with an aqueous liquid containing iodide ions that remain in said hydrophilic binder layer during the lamination procedure and form part of said binder layer in the laminar article. Said treatment results in better whites and less darkening of the dye parts of the dye image.
