Abstract (en)
[origin: EP0250973A2] In the case of a centrifugal pump with an impeller (10), which is located centrally behind an inlet aperture (16) and surrounded by a pump chamber (14) adjoined by a collecting chamber (11), which has an outlet aperture (12), the intake rate, particularly the dry intake, is improved by the fact that the pump chamber (14) is sealed off from the collecting chamber (11) in a radial direction by side walls (17), the side walls (17) having at least one through passage (18) and the entire area of the through passage being between 100 and 200% of the size of the inlet aperture (16). <IMAGE>
