Abstract (en)

[origin: EP0251323A2] The safety device serves for a roller door 6 or the like for acting on a motor-driven winding cylinder 5. In this device, a dynamically self-locking worm 8 is provided which is driven by an actuating motor 17 and has a meshing worm wheel 7 which is rotationally fixedly secured to the shaft 9 of the winding cylinder 5 for the roller door 6. The worm 8 can be displaced in at least one direction 14 along its shaft 9 to a stop 15 and is driven in a controlled manner by an actuating motor 17 via a control 18 in such a manner that it is automatically rotated back to the extent by which it would be displaced by the worm wheel in the direction of the shaft 9. However, when the roller door drops down, the worm 8 is pushed by the worm wheel 7 onto the stop 15, and, when the latter is reached, the worm wheel 8 is stopped as result of the dynamic self-locking with the worm 8, as a result of which the dropping down of the roller door 6 is complete. <IMAGE>
