Abstract (en)  
[origin: EP0253232A2] In the comminuting device (1), which is based on German Patent Specification 2 934 792, flexible material is introduced into the housing (2) containing the cutting mechanism (8) through a central receiving device (4) and stiffer material through a separate branch receiving device (5). The cross sections of the feed-in openings (13) depend on safety regulations, and this means that branches and similar stiff material has to be prepared so that it can be introduced into the branch receiving device (5). To avoid this effort, the invention proposes designing the feed-in opening (13) of the branch receiving device (5) in a keyhole shape (14, 15). This makes it possible to introduce twisted or spreading branch structures into the device (1) without special preparation and without the safety regulations being ignored. <IMAGE>
