Abstract (en)
[origin: EP0253694A1] The device comprises a rupture device accommodated in a housing (1) which comprises an angularly adjustable fixed-contact support (7). On an arm (7b) folded at right angles this support has part of the means of adjusting (9) the contact points, adjustment being performed outside the housing (1) by the rotation of the drive head of an adjusting element (9) crossing the partition of the said housing (1) and carrying at its free end a cam (95) which is supported in its rotational movement on the lateral edges of a port (7c) made in the folded arm (7b) of the support. A flexible spacer (93) is inserted between the circular inside wall of the housing (1) and an axial stop means (97, 96) of the adjusting element (9) to form a plane both roughly perpendicular to the reference axis of the said adjusting element (9) and parallel to the folded arm (7b) of the support (7) for the contact fixed in a middle adjustment position. <IMAGE>
