Abstract (en)

The device comprises an actuator member (24) subjected to the action of a spring (26), for expelling and driving fastening elements such as staples, nails and the like. One end of a first lever (34) engages the actuator element (24) during its spring-loading stroke. The lever (34) is pivotally mounted on the body of the device and has its other end engaged by a second lever (39) whose point (40) of pivotal mounting on the device is farther away from the actuator member (24) than the point (35) of pivotal mounting of the first lever (34). This makes the device easier to operate. The first lever (34) is provided with a slot (37) in the region of the point (35) of pivotal mounting on the body and its normal rotation during the actuator member loading stage is arrested by a fixed projection (44), after which the lever (34) performs an essentially translatory movement with rapid disengagement of the actuator member (24), which is thus free to expel a fastening element.
