Abstract (en)

[origin: EP0254810A2] A cap unit (1) for closing bottles, in particular medicine bottles, has a drop counter tube (3) and a cap (4) placed on top of said tube, by means of which cap the drop counter tube (3) can be closed again after it has been opened. In the unopened original state, the cap unit (1) cannot be separated from the bottle. In the unopened original state, the cap (4) is connected in one part and via a reference break point (5) to the attachment base (6) of the cap unit (1) and can be opened by breaking open said reference break point (5). Initial use is revealed by a base spacing between the cap (4) and the attachment base (6) of the cap unit (1) in that it exposes the view to the visually different drop counter tube. <IMAGE>
