Abstract (en)  
[origin: EP0255204A2] An electrical test connector (10 or 10') adapted for interconnecting a first (not shown) and second connector (12) includes a housing (14) defining a plurality of terminal receiving cavities (16) with a terminal (18) mounted in each cavity. The terminal has a first end portion (20) for mating engagement with the first connector and a second portion (24) extending out of the housing (14) for electrical connection with the second connector (12). An exposed terminal portion (34) extends between the test connector housing (14) and the second connector (12) providing access for in-use testing. A first insulated alignment member (36) is disposed adjacent the test connector housing (14) and includes a plurality of passages (38) (see Fig. 2) for receiving and for maintaining alignment of the second terminal portions (24) of the terminals (18). A second insulated spacer member (40) is axially spaced from the first insulated member (36) and has a plurality of passages (42) for receiving and holding the second terminal portions (24) to define exposed terminal portions (34).
