Abstract (en)

A device for checking the clamping of cabins to the cable of a continuous cableway with automatic coupling, comprising a rocker arm (46) one end of which consists of a leaf spring (52) adapted to exert a predetermined elastic force on the coupling clamp (16) to urge it to slide parallel to the cable during the elastic engagement of the spring (52) with a fixed guide (68). This guide (68) is situated downstream of the automatic cabin-coupling zone.
