Abstract (en)

[origin: EP0255886A2] In order to be able to align a door closer (2) in a floor case (1) both in the longitudinal and in the transverse direction of the floor case or of the longitudinal axis of the door closer, a device is provided for securing the door which permits, on the one hand, the two-dimensional alignment inside the horizontal plane and, on the other hand, provides a link between the floor case and the door closer which is capable of absorbing any load occurring when the door linked to the door closer (2) is operated. Essential components of said securing device are the base part (9) which is permanently joined or joinable to the floor case (2), the holding part (10) which is permanently joined or joinable to the door closer (2) and at least one holding device (11) inserted between the base part and the holding part. Preferably, at least one clamping device (29) is also present which additionally secures the permanent joint. <IMAGE>
