Abstract (en)

[origin: WO8704633A1] Musculation apparatus, particularly for re-educational purposes, comprising a fixed support for at least one extensible elastic member (14) connected to the extremity of a pulley element (18) of predetermined and adjustable length. The invention is characterized in that said element (18) is guided by a first space-orientable pulley (19) of which the anchor point is invariable with respect to the fixed support (2-8), and by a second pulley (22) of which the position may be changed on said support or on any other support so that the variation of the position of the second pulley with respect to the first pulley makes it possible to adjust the direction of the effort exerted by the user or providing a resistance to another equipment element placed indifferently with respect to the board.
