Abstract (en)

[origin: US4809121A] A circuit arrangement in motor vehicles with electrical adjusting members coordinated to equipment components, to which belongs individually a manually actuatable switch and a control unit which upon initiation thereof, energizes the adjusting member for the automatic displacement of the equipment component into an end position; the control units are thereby adapted to be de-energized during the time interval engagement of the adjusting member upon actuation of any switch even prior to reaching the end position. A frequently cumbersome locating of the associated individual switch, respectively, the correct actuation during the automatic movement of the equipment component is dispensed with thereby.
