Abstract (en)

[origin: EP0258158A1] This system consists in providing at least one line of weakening (16) extending longitudinally over the face (15) of this box (25) and intended to be placed on the side of the first building part. Each line of weakening (16) can be formed by a reduction in the thickness of the material of the face (15) of the box (25), or by a succession of small aligned holes. Upon extraction of the box (25), this or these line(s) of weakening (16) cause(s), when traction is exerted on the accessible part of the box (25), the bottom of this box (25) to rupture along this or these line(s) of weakening (16), and the box (25) can then be extracted in one piece whatever its shape. <IMAGE>
