Abstract (en)

[origin: EP0258515A1] The web (1) of tissue, film, paper, fibrous material or the like is divided by perforations (2) into individual portions, is preferably impregnated by a liquid and is to be stored in a container (5) and can be removed by being pulled through a restrictive opening (6). The connection webs (4) remaining in the region of the perforations (2) are arranged offset relative to the longitudinal direction of the web (1). In order to achieve a uniform tearing-off of the portions allowing the subsequent portion to be gripped when the web is pulled out of the container, the web (1) is folded at least once in its longitudinal direction. <IMAGE>
