Abstract (en)

[origin: EP0258591A2] The lateral sliding door has altogether three door leaves (3, 4, 5), of which only an outer one is equipped with a drive (10). To transmit the drive movement of the driven outer door leaf to the other two door leaves, there is arranged respectively on the driven door leaf (3) and on the middle door leaf (5) an endless chain (17 or 23) guided along the door leaves via deflecting wheels (13, 14; 24, 25). One strand (17a) of the chain of the driven door leaf (3) is connected firmly to a fixed anchorage (21) and the other strand of this chain (18) or of one parallel to this is connected firmly to the middle door leaf (4). Furthermore, between the endless chains of the driven door leaf and of the middle door leaf there is a step-down gear (27) which consists of a rotary axle (28) mounted in the middle door leaf and with chain wheels (25, 29) of differing diameter which are held on this axle at both ends fixedly in terms of rotation and of which one is a deflecting wheel of the chain of the middle door leaf and the other of smaller diameter engages into a strand of the chain of the driven door leaf. The non-driven outer door leaf (5) is connected firmly to a strand of the endless chain of the middle door leaf. <IMAGE>
