Abstract (en)
[origin: EP0258679A2] Handle (12) in a bag (1) of plastics foil, which foil is joined and/or folded to form a flat tube with at least two layers of foil placed on top of each other, and in which the two layers are joined by means of crosswise weldings (10, 11) enclosing between the two foils a cavity for enclosing the contents of the bag (1), which handle (12) comprises a punching (13) forming an opening through at least one of the layers of foil. In order to obtain an optimal utilization of the foil used for manufacture of a bag (1) with a predetermined volume, the punching (13) is placed in the portion of the bag (1), which is intended for enclosing the contents, and the punching (13) is surrounded by a welding (14) joining the two layers. The handle (12) is particularly advantageous in bags comprising a filling valve, the handle (12) being placed in the opposite end of the filling valve.
