Abstract (en)
[origin: WO8604854A1] Razor of the type comprising a blade housed and integrally held within a support head which is itself integral with a razor body (5) extended perpendicularly to the cutting edge of the blade. The razor is characterized in that the integral assembly thus formed by the blade (1), its support head (3) and the razor body (5) carries at the vicinity of the support head (3) an electric motor (7) carrying on its shaft (12) an excentric weight (11) so that the support head (3) describes in parallel to the cutting edge (2) of the blade (1) a motion of low amplitude and high frequency, and in that the support head (3) is provided with removable locking and holding elements which make the support head firmly integral with the razor body (5). The invention enables to make a razor wherein the cutting edge describes a trajectory without displacement of the blade with respect to the support head nor to the razor body.
