Abstract (en)
[origin: CA1327033C] A tablet dispenser which has a sleeve and a magazine for holding the tablet stack, which magazine is guided in this sleeve and has an essentially U-shaped crosssection and a base connecting the limbs and, for filling purposes, can be pushed partially out of the sleeve against the force of a spring arranged between the base of the magazine and a cup-like slide which is displaceable in the magazine and in the sleeve and acts as a plate spring, the slide being guided in the magazine to prevent complete tilting in the said magazine and being provided with lateral projections, one of which passes through a slot arranged in the web of the magazine and engages a groove running in the longitudinal direction of the sleeve and the other projection engages a further longitudinal groove of the sleeve, which longitudinal grooves are at least partially closed at the push-out end of the sleeve and form stops for the projections of the slide. To avoid danger due to parts, such as, for example, the spring, jumping out, even during improper treatment of the tablet dispenser leading to at least partial destruction of the said dispenser, it is envisaged that the projection of the slide, which projection passes through the slot of the magazine, is provided with a hammer-head and, preferably, a pin stop which is arranged close to the base of the magazine, on the latter, engages between two coils of the spring.
