Abstract (en)
[origin: US4775420A] Complex pigment compositions for the coating of paper, comprising an aqueous phase, at least one pigment of mineral origin, a binding agent, optionally various customary additives, and a dispersing agent comprised of carboxyl-containing polymers which are water soluble and are converted to form salts. The polymers are obtained by known polymerization processes. The dispersing agent (a) has a specific viscosity (measured on the sodium salt) of between 0.25 and 2; and (b) is converted to the salt form to the extent of at least 60% by at least one salt-forming agent which has a polyvalent function. These complex pigment compositions have very low viscosities. They may also simultaneously contain diverse pigments, such as kaolin, titanium dioxide, and calcium carbonate, without suffering the usual increase in viscosity and the risk of setting.

Abstract (fr)
Compositions pigmentaires complexes pour l'enduction du papier comprenant une phase aqueuse, au moins un pigment d'origine minérale, un agent liant, éventuellement divers additifs usuels et un agent dispersant constitué par les polymères carboxyliques hydrosolubles sous une forme salifiée obtenus par les procédés connus de polymérisation qui se caractérisent en ce que l'agent dispersant : a) dispose d'une viscosité spécifique comprise entre 0,25 et 2 (mesurée sous la forme d'un sel de sodium), b) est salifié à un taux d'au moins 0,60 par au moins un agent de salification disposant d'une fonction polyvalente. Ces compositions pigmentaires complexes qui offrent de très faibles viscosités peuvent contenir simultanément des pigments aussi divers que kaolin, dioxyde de titane, carbonate de calcium, tout en éliminant les habituelles augmentations de viscosité et les risques de prise en masse.
